For my Gant chart I've allocated the run over to the part of the implementation phase, owing it a problem in the initial configuration and setup of the system. This is usually where things go wrong in real world projects and nearly all the projects I've worked on. From there I would handle this issue but taking an all-hands-on deck approach, allocating all available man power to powering through the given issue. This solution works on the assumption that the setback in the given scenario is down to a configuration issue and not a lack of tools or resources, meaning pre-existing systems or software can be fixed or changed to account and rectify this issue.
